REACH-IN AND ROLL-IN Refrigerators, Freezers and Heated Holding Cabinets

Installation, Use & Care Manual

This manual is updated as new information and models are released. Visit our website for the latest manual. www.manitowocfsg.com
Safety Notices

As you work on Manitowoc equipment, be sure to pay close attention to the safety notices in this manual. Disregarding the notices may lead to serious injury and/or damage to the equipment.

Throughout this manual, you will see the following types of safety notices:

⚠️ Warning
Text in a Warning box alerts you to a potential personal injury situation. Be sure to read the Warning statement before proceeding, and work carefully.

⚠️ Caution
Text in a Caution box alerts you to a situation in which you could damage the equipment. Be sure to read the Caution statement before proceeding, and work carefully.

Procedural Notices

As you work on Manitowoc equipment, be sure to read the procedural notices in this manual. These notices supply helpful information which may assist you as you work.

Throughout this manual, you will see the following types of procedural notices:

⚠️ Caution
Proper installation, care and maintenance are essential for maximum performance and trouble-free operation of your Manitowoc equipment. Read and understand this manual. It contains valuable care and maintenance information. If you encounter problems not covered by this manual, do not proceed, contact Manitowoc Foodservice Group. We will be happy to provide assistance.

⚠️ Important
Routine adjustments and maintenance procedures outlined in this manual are not covered by the warranty.

⚠️ Warning
PERSONAL INJURY POTENTIAL
Do not operate equipment that has been misused, abused, neglected, damaged, or altered/modified from that of original manufactured specifications.

NOTE: SAVE THESE INSTRUCTIONS.

NOTE: Text set off as a Note provides you with simple, but useful, extra information about the procedure you are performing.

We reserve the right to make product improvements at any time. Specifications and design are subject to change without notice.

Model/Serial Number Location

The McCall data plate which includes the model number and serial number, as well as important electrical and technical information, is located on the left interior wall of the cabinet at approximately eye level.

For convenience and quick reference, record the model and serial numbers, voltage, and installation date in the spaces below:

Model Number _______________________________
Serial Number ________________________________
Voltage _____________________________________
Installation Date ______________________________

Warranty

Warranty coverage on a McCall reach-in begins on the date it is installed. Please read the warranty certificate included with the cabinet for details.

PARTS COVERAGE

1. McCall warrants the cabinet, refrigeration, and mechanical components against defects in materials and workmanship for a period of one (1) year from the date of original installation.

LABOR COVERAGE

Labor is covered for (1) year.

EXCLUSIONS FROM WARRANTY

1. Normal start-up, maintenance, adjustments, and cleaning.
2. Damage caused by improper installation of the McCall cabinet as outlined in this manual.
3. Labor charges resulting from the inaccessibility of the McCall cabinet.
4. Damage to parts due to misuse, abuse, neglect, or accidents.
5. Premium labor rates due to holidays, overtime, travel time, mileage, etc., not specifically authorized by McCall prior to service.
6. Miscellaneous tools or materials charges.
7. Repairs due to modifications to the McCall cabinet or refrigeration system not authorized by McCall in writing.
8. Claims for indirect or consequential damages, including food spoilage or product loss.
9. Damage due to faulty or incorrect power supply, floods, storms, or other acts or God.

Warranty Service

To ensure warranty coverage, a qualified service company, authorized by McCall, must perform the warranty repair.

If the dealer the McCall reach-in was purchased from does not perform warranty service, please contact the McCall Service Department for assistance.
Warranty Certificate

McCall warrants to the original Purchaser-User its product as per the following schedule:

- **All Parts**: One year from original installation.
- **Labor**: One year from original installation.
- **Compressor**: One year from original installation.

The obligation of McCall under this warranty is limited to McCall repairing or replacing, free of cost to Purchaser-User, any part or parts, that to the judgement of McCall show evidence of defect, and provided that upon McCall authorization, said part or parts to be returned to McCall, transportation prepaid, for inspection and judgement. This warranty covers only McCall manufactured self-contained cabinets.

This warranty is issued only to the original Purchaser-User, is not transferable, applies only to unit installed within the United States of America, its territories and Canada and is in lieu of all other warranties expressed or implied. McCall neither assumes nor authorizes any other person to assume for McCall any liability not herein stated.

McCall shall not be liable for any damage or delays occurring in transit, for any default or delays in performance caused by any contingency beyond its contract including wars, government restrictions or restraints, strikes, short or reduced supply of raw materials, fire, flood or other acts of God, nor for damage or loss of any products, property, loss of income or profit due to malfunctioning of sold unit.

Section 2
Installation Instructions

General

⚠️ Caution
These instructions are of the utmost importance in assuring that the McCall cabinet operates as designed, and must be followed closely. Please call your local McCall dealer or the McCall Service Department if you have any questions regarding proper installation.

Installing the Cabinet

⚠️ Caution
When selecting a permanent location for the cabinet, observe the following guidelines. Failure to do so may cause reduced performance and efficiency, cause damage, and void your warranty.

⚠️ Caution
CABINET LOCATION GUIDELINES
- Install the cabinet in an indoor environment only.
- The air temperature entering the refrigerator or freezer condenser should be between 55°F (13°C) and 100°F (38°C).
- Allow space for air circulation in the refrigeration condensing unit compartment on refrigerators and freezers. The minimum space requirements are:
  - 10" (25 cm) on top
  - 4" (10 cm) at the back
  - 4" (10 cm) on each side
- The floor must be strong enough to support the weight of the cabinet and product load.

⚠️ Caution
A fully loaded reach-in or roll-in cabinet can weigh more than 3,000 pounds.

Cabinet Clearances (Typical Single Door Cabinet Shown)
Uncrating

**Warning**

Never attempt to tilt the cabinet alone. Always use two or more people when tilting the cabinet to remove the shipping skid or to move it through doorways.

1. Remove the bottom shipping skid using one of the methods below:
   - Lay the cabinet on its back, elevated and supported by wooden blocks. Remove the skid mounting bolts and separate the skid from the cabinet.
   - Tilt the cabinet from side to side and remove the mounting bolts. Support the weight of the cabinet apart from the skid.

2. Install the legs or casters and torque them to 360 inch-pounds. Refer to the drawing at right.

**NOTE:** Roll-in style cabinets do not have legs or casters. Refer to the drawing at right for ramp installation.

3. Return the cabinet to the upright position.

4. Remove any remaining crating materials.

**Caution**

If the cabinet was placed on its back while moving it or while removing the bottom shipping skid, wait at least two hours after returning the cabinet to the upright position before starting the refrigeration system.

**Caution**

Never use sharp instruments to cut the plastic or cardboard crating materials. Damage to the cabinet exterior may result.

---

**Installing Cabinet Legs**

**Ramp Installation**
Leveling the Cabinet

The cabinet must be leveled after it is positioned in its permanent location. This ensures proper door alignment on all cabinets, and adequate condensate water drainage and proper refrigeration system operation on refrigerators and freezers.

Follow the appropriate procedure below.

LEVELING A REACH-IN CABINET

1. Place a level on top of the cabinet.
2. Turn the leveling foot of the lowest corner leg to center the bubble in the level.
3. Adjust each of the other corners until the bubble is centered and the cabinet is stable.
4. Re-check the cabinet from side to side and from front to rear with the level.

LEVELING A ROLL-IN CABINET

Roll-in cabinets are designed to sit directly on the floor without legs or casters.

1. Use shims to level the cabinet if necessary.
2. Seal the bottom perimeter of the cabinet to the floor with NSF-approved silicone.
3. Install the ramp(s). Refer to the drawing on the previous page.

Shelf/Tray Slide Installation

SHELVES

1. Determine the desired shelf location.

NOTE: The shelves may be located at any position in 1" (2.5 cm) increments. Optimum spacing is one shelf near the bottom of the cabinet, one shelf near center height, and one shelf at eye level (refer to drawing).

2. Install four clips per shelf, one at each corner. The shelf clips slip into the 3/8" holes and slide down.
3. Make sure that the clips are level from side to side and from front to rear at each corner.
4. Install the shelves with the smaller wires running from front to back.

Caution

If casters are installed instead of legs, the floor must be leveled before final positioning of the cabinet.
Electrical Requirements

All cord-connected units should be plugged into a grounded and properly sized electrical outlet with appropriate overcurrent protection. Refer to the drawing below for electrical plug configurations.

All permanently connected (hard wired) units are fitted with a power junction box and 6" pigtail wires for power connection.

Connect one end of the power line to the pigtail from the cabinet junction box. Connect the other end to a properly sized electrical source.

As a rule, the power lines must be enclosed inside a conduit secured to the power junction boxes on both ends.

**Caution**

Power installation must be in compliance with the National Electrical Code and all applicable local and state codes.

**Warning**

Never use an extension cord.

Never alter the power cord or plug supplied with the cabinet.

After the power source has been connected, turn on the main power switch. The switch is located on the cabinet top, behind the front louvered panel.

Section 3
Operation

Sequence of Operation

REFRIGERATORS – SELF-CONTAINED

Cooling Cycle
With the main ON/OFF switch in the ON position, the current flows, energizing the evaporator fan motors. Current also flows through the closed contacts of the temperature control, energizing the condenser fan motor and the compressor.

Off Cycle
When the temperature control senses the proper temperature, it opens, shutting off the refrigeration system.
The refrigeration system remains off until the temperature control senses approximately 38°F (3.3°C). (This also keeps the evaporator defrosted.) At that time, the temperature control closes and starts the refrigeration system.

REFRIGERATORS – REMOTE

Cooling Cycle
With the main ON/OFF switch in the ON position, the current flows, energizing the evaporator fan motors. Current also flows through the closed contacts of the temperature control, energizing the liquid line solenoid valve. The increase in suction pressure causes the contacts on the low pressure switch to close, energizing the refrigeration system.

Off Cycle
When the temperature control senses the proper temperature, it opens, shutting off the liquid line solenoid valve. The drop in suction pressure causes the low pressure switch to open, de-energizing the refrigeration system.
The refrigeration system remains off until the temperature control senses approximately 38°F (3.3°C). (This also keeps the evaporator defrosted.) At that time, the temperature control closes and starts the refrigeration system.
FREEZERS – SELF-CONTAINED

Cooling Cycle
With the main ON/OFF switch in the ON position, the current flows, energizing the automatic defrost time clock.

Current also flows through the closed contacts of the temperature control, energizing the condenser fan motor(s) and the compressor.

With contact N closed on the automatic defrost time clock, current will flow through the normally open (N.O.) light/fan switch contacts (with the door closed).

When the evaporator coil temperature reaches 30 to 35°F (-1.1 to 1.7°C), the defrost end and fan delay thermostat closes, energizing the evaporator fans.

Defrost Cycle
At preset times on the automatic defrost time clock, the contacts switch to defrost the evaporator. Contact N opens, de-energizing the evaporator fan motor(s). Contact #4 opens, de-energizing the refrigeration system. Contact #1 closes, energizing the evaporator defrost heater.

As the evaporator temperature rises, the defrost end and fan delay thermostat opens to terminate the defrost cycle. Contact #1 opens, de-energizing the defrost heater. Contacts N and #4 close, energizing the refrigeration system.

Off Cycle
When the temperature control senses the proper temperature, it opens, shutting off the refrigeration system.

FREEZERS – REMOTE

Cooling Cycle
With the main ON/OFF switch in the ON position, the current flows, energizing the automatic defrost time clock.

Current also flows through the closed contacts of the temperature control, energizing the liquid line solenoid valve. The increase in suction pressure closes the contacts on the low pressure switch, energizing the refrigeration system.

With contact N closed on the automatic defrost time clock, current flows through the normally open (N.O.) light/fan switch contacts (with the door closed).

When the evaporator coil temperature reaches 30 to 35°F (-1.1 to 1.7°C), the defrost end and fan delay thermostat closes, energizing the evaporator fans.

Defrost Cycle
At preset times on the automatic defrost time clock, the contacts switch to defrost the evaporator. Contact N opens, de-energizing the evaporator fan motor(s). Contact #4 opens, de-energizing the refrigeration system. Contact #1 closes, energizing the evaporator defrost heater.

As the evaporator temperature rises, the defrost end and fan delay thermostat opens to terminate the defrost cycle. Contact #1 opens, de-energizing the defrost heater. Contacts N and #4 close, energizing the refrigeration system.

Off Cycle
When the temperature control senses the proper temperature, it opens, shutting off the liquid line solenoid valve. The drop in suction pressure causes the low pressure switch to open, de-energizing the refrigeration system.
Condensate Water Removal – Refrigerators and Freezers

McCall cabinets are equipped with condensate vaporizer systems.
Remote units use an electrically operated system.
Most self-contained units use energy-saving hot gas supplied by the refrigeration system lines. No drain connection is required.

Defrost Systems

GENERAL
Refrigerator coils are kept below the freezing point (32°F). During compressor “off” time, the evaporator fan continues to circulate 38°F refrigerator compartment air through the evaporator coil. This air circulation raises the coil temperature above the freezing point, melting any frost that may have accumulated.

The run-off water is drained into the vaporizer pan and is evaporated by the hot gas refrigeration line during compressor “on” time.
Freezer coils are defrosted electrically at user-determined times.

NOTE: A freezer’s evaporator fans do not run immediately upon start-up or during and immediately following the defrost cycles. The fans start when the coil reaches a cold temperature. This prevents the fans from blowing heated air on the stored products.

DEFROST SETTINGS

<table>
<thead>
<tr>
<th>Important</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set the defrost timer to defrost the reach-in during the lowest usage periods.</td>
</tr>
</tbody>
</table>

Each defrost tripper represents 15 minutes of defrost time. At the factory, the timer is set for four automatic defrost cycles daily at 4:00AM, 10:00AM, 4:00PM, and 10:00PM respectively. Each defrost cycle is programmed for 45 minutes duration. Upon start-up, set the clock for the correct time of day by rotating the clock face until the correct time is at the arrow on the face of the timer.

NOTE: If the defrost termination thermostat fails to close, the fail safe setting on the timer will terminate the defrost.

The timer starts the defrost cycle automatically at predetermined times. A setting of two to four defrost cycles per day is typical. For heavier frost loads, additional cycles may be required.

When the defrost cycle begins:

1. Switch 2 to 4 opens in the time clock, breaking the circuit to the room thermostat, liquid line solenoid, and evaporator fan motors. This allows the compressor to pump down and shut off. Simultaneously, switch 1 to 3 closes in the timer, energizing the defrost heaters.
2. The heaters increase the coil temperatures above 32°F, melting the frost off the coil.
3. When the coil warms to approximately 55°F, the defrost termination thermostat closes and energizes the switching solenoid in the timer. At this time, switch 1 to 3 in the timer opens, terminating the defrost heaters. Simultaneously, switch 2 to 4 closes in the time clock, energizing the temperature control circuit.
4. Suction pressure rises, the low pressure control closes, and the compressor starts.
5. The fan relay closes when the coil temperature reaches approximately 30°F. This energizes the fan motors.
6. The system operates in the refrigeration cycle until another defrost cycle is initiated by the timer.
Temperature Controls

REFRIGERATORS AND FREEZERS

The temperature controls are factory-set to maintain an average temperature of 38°F in refrigerators, and an average temperature of 0°F in freezers.

The temperature variance is 6-8 degrees. A freezer should run between -2 to -3°F and +3 to +4°F. A refrigerator should run between +35 to +36°F and +41 to +42°F.

For a different cabinet temperature setting, turn the temperature control knob, located behind the front cabinet louver.

| Caution |
| Setting the temperature control to the coldest setting may cause the coil and/or air ducts to freeze and ice up. This will eventually result in a warmer cabinet temperature. |
| If ice accumulation occurs and the temperature is lower than the guidelines, turn the control knob to a warmer setting. |

REACH-IN HEATED CABINETS

Single-section reach-in heated cabinets are designed to maintain a temperature of up to 170°F. Two-section and three-section cabinets can maintain a temperature of up to 140°F.

The temperature control knob is located on the top front louver. Turn the knob clockwise to raise the temperature, and counterclockwise to lower the temperature.

| Caution |
| Allow the reach-in to reach proper operating temperature before filling it with product. Do not place hot or steaming foods in the cabinet. |

ROLL-IN HEATED CABINETS

The temperature control panel on a roll-in heated cabinet is located on the front louver panel.

Roll-in Heated Cabinet Control Panel

To adjust the interior cabinet temperature:

1. Make sure that the main power switch (located behind the front louver) and the on/off switch (on the front louver panel) are both ON.
2. Press the SET pad once. “SP1” is displayed.
3. Press the SET pad again to display the numerical set point.
4. To change the temperature, press the up or down arrow.
5. Press the SET pad repeatedly until the display goes blank. After 5 seconds, the screen will display the interior temperature of the cabinet.

NOTE: While the heating element is energized, a small LED light is illuminated between the first 2 digits of the temperature display.

| Important |
| If the programming sequence is interrupted for more than 15 seconds, or not completed through Step 5 (blank screen), the unit will automatically revert to the temperature display mode without accepting the new setting. |
Loading Shelves – Reach-in Cabinets

For maximum operating efficiency, load the shelves with space between the stored items. This allows air to circulate properly. Refer to the drawing below.

⚠️ Caution
Do not store more than 250 pounds of product on any shelf, and no more than 800 pounds of product per cabinet.

⚠️ Caution
Store products with high acid content (such as lettuce, other fresh vegetables or fruits, salad dressings, etc.) in closed containers. This will prevent corrosion on the evaporator coil and other metal parts in the air distribution system.

Important
Uncovered food will dehydrate much more rapidly than covered food. For best food quality, always store in covered containers.

⚠️ Warning
In a heated cabinet, the shelves, interior cabinet surfaces and food containers are hot. Use care when storing or removing product.

Loading Carts – Roll-in Cabinets

Roll-in cabinets are designed to accept carts of pre-heated food (heated units) or pre-chilled or frozen food (refrigerators or freezers).

Cart guides have been installed in each cabinet bay to keep the cart away from the interior walls. Center the cart(s) in the bay(s) for best air circulation. Refer to the drawing below.

Important
Uncovered food will dehydrate much more rapidly than covered food. For best food quality, always store in covered containers.

⚠️ Warning
In a heated cabinet, the cart(s), interior cabinet surfaces and food containers are hot. Use care when storing or removing product.

Positioning a Cart in the Cabinet
Adjustments and Calibrations

ADJUSTMENTS

Cabinet doors may require some adjustment after a period of usage, depending upon the frequency of door openings. This is normal. Follow the appropriate procedure below:

Solid Door Adjustment

1. Remove the metal hinge covers that conceal the three hinge mounting screws. Gently pry it off with a flat-bladed screwdriver.

2. Loosen the three hinge mounting screws approximately two rotations, using a Phillips screwdriver.

3. While a second person firmly pushes the door closed to the front face of the cabinet, re-tighten the screws.

4. Re-install the hinge covers.

Glass Door Adjustment

To adjust the spring tension:

1. Locate the adjustment bushing on the hinges. This bushing is on top of the hinge for right-hand doors and on the bottom for left-hand doors.

2. Insert a small nail (1/8") into a hole in the adjustment bushing. Wind the bushing clockwise until the pin can be removed from the bushing.

3. Continue winding the bushing clockwise until the desired tension is achieved.

4. Re-insert the bushing pin.

Caution:

Do not over-tighten the hinge spring. McCall recommends adjusting the hinge adjustment bushings one hole at a time.
CALIBRATIONS
Occasionally, the rigors of shipping and installation can shift the thermometer out of proper adjustment.
If the accuracy of the thermometer is in question, place another thermometer inside the cabinet at approximately mid-height and compare the readings.
If the thermometer requires adjustment, follow the appropriate procedure below.

Digital Thermometer Calibration
1. Lift up on the front cabinet louver about 5/8” to 1” (16 to 25 mm) to disengage the keyhole slots from the four screws in the cabinet front. Remove the louver.
2. Cut the plastic tie holding the thermometer probe wire, taking care not to cut the wire. This releases the full length of the probe wire, allowing the louver to be lowered to the floor.
3. Locate the two dip switches on the thermometer rear. Set both switches to ON.
4. Locate the blue calibration screw in the upper right corner of the thermometer. Turn the screw clockwise to increase the temperature reading or counterclockwise to decrease the reading.
5. Reset the two dip switches to their original position.
6. Re-install the front louver to the cabinet. Position the keyhole slots in the louver rear on the four screws in the cabinet front. Push it straight down until the louver locks into place.
7. Re-tie or tape the excess length of probe lead wire.

Dial Thermometer Calibration
1. Gently pry off the clear thermometer cover lens with a small flat-bladed screwdriver.
2. While carefully holding the dial indicator needle with one hand, turn the slotted center pivot with a flat-bladed screwdriver. Turn clockwise to decrease the reading and counterclockwise to increase the reading.
3. Replace the clear thermometer cover lens by pressing it into place around the perimeter.

Important
Do not disconnect the probe wire from the rear of the thermometer display.
Section 4
Maintenance

Cleaning Recommendations

EXTERIOR
Clean cabinet exterior surfaces with a solution of mild soap and water. To minimize streaking, follow with a fresh water rinse.
If stainless steel becomes discolored, scrub only in the direction of the finished grain.
For high shine, see your kitchen equipment dealer for a high-quality stainless steel polish.

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not use steel wool, caustic soap, or abrasive cleaners, as these may damage the metal finish. Alcohol-based cleaners may damage the nylon door cams.</td>
</tr>
</tbody>
</table>

INTERIOR
Clean cabinet interior surfaces with warm water and baking soda, applied with a cloth or sponge.
The air duct and shelf support standards can be removed without special tools to facilitate cleaning.
Wash door gaskets weekly with a mild soap and water solution, followed by a fresh water rinse.
While cleaning, check the door gaskets for proper sealing. Adjust if needed.

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Never use cleaners that are not approved for use where food may come into contact with cabinet interior surfaces.</td>
</tr>
</tbody>
</table>

<table>

Cleaning the Condenser Coil – Refrigerators and Freezers

**Warning**
Disconnect electric power before cleaning.

For efficient operation, it is very important to clean the condenser coil surface and keep it free of dust, dirt, and lint. McCall recommends checking the condition of the condenser coil once a month.

The condensing unit fan draws dust, lint and small particles to the condenser coil, where it forms a “blanket” on the coil surface. This is normal and should be periodically removed.

**Caution**
Failure to clean and maintain the condenser coil properly will result in reduced air circulation through the condenser fins. This will cause reduced efficiency, high operating pressures, and possible shortened compressor life.

**CONDENSER CLEANING PROCEDURES**
One or more of the following methods may be used to clean the condenser coil surface, depending upon the extent of the build-up on the fins.

**Warning**
Condenser fins are sharp. Use care when working around them.

**Method 1**
Remove light build-up with a soft brush or a vacuum with a brush attachment. Brush the condenser fins from top to bottom, not from side to side. Shine a light through the fins to check for dirt inside the condenser.

**Method 2**
Clean moderately dirty fins with compressed air, blowing from the inside out. Follow by brushing, if necessary.

**Method 3**
Clean with a commercial condenser coil cleaner, available from a kitchen equipment dealer. Follow the directions and precautions supplied with the cleaner. After cleaning, straighten any bent condenser fins with a fin comb.

**CLEANING THE FAN BLADES AND MOTOR**
If necessary, clean the fan blades and motor with a soft cloth. If it is necessary to wash the fan blades, cover the fan motor to prevent moisture damage.
Component Replacement Procedures

**Warning**

Disconnect electric power before performing any service.

EVAPORATOR FAN MOTOR – 1 SECTION
REFRIGERATORS AND FREEZERS

If Mounting Bracket Is Not Broken

1. Remove *Windrunner* air distribution duct from the cabinet interior ceiling.

2. Disconnect the (2) terminal connectors from the motor.

3. Using a 1/4" nut driver, remove the (2) motor mounting screws and separate the motor from the bracket.

4. Reverse steps 1-3 to replace motor.

5. Reconnect power and return to normal use.

NOTE: The evaporator-housing lid may be removed to provide added lighting and visibility.
If Mounting Bracket Is Broken

1. Remove the *Windrunner* air distribution duct from the interior ceiling.

2. Disconnect the (2) terminal connectors from the motor.

3. Using a 1/4" nut driver, remove the (2) motor mounting screws and separate the motor from the bracket.

4. Remove the evaporator-housing lid, located on the cabinet top.

5. Remove the coil mounting screws and carefully lift the coil, only enough to gain access to the motor mounting screws.

Continued on next page ...
Section 4 Maintenance

6. When the coil has been moved, remove the evaporator drain pan by removing (4)-mounting screws.
7. Remove the bracket mounting screws and replace bracket-motor assembly.
8. Reverse steps 1-5 to complete motor installation.
9. Reconnect power and return to normal use.

LIGHT SWITCH
1. Remove the door by lifting straight up. Carefully set the door aside.
2. Pry off the TOP hinge cover on the cabinet hinge flange with a flat blade screwdriver or flat scraper.
3. Remove the (3) hinge mounting screws and carefully pull the hinge flange from the cabinet front.
4. Slide the light switch and switch retainer from the hinge. Unplug the switch.
5. Install the new switch into the hinge and replace the door hinge onto the cabinet front. Install the (3) mounting screws. Snug the screws but DO NOT tighten fully.
6. Re-hang the door onto the hinges.
7. Make sure that the door is hanging plumb and that the door operates properly.
8. Tighten the screws and replace the hinge cover.
EVAPORATOR FAN MOTOR – 2 AND 3 SECTION REFRIGERATORS AND FREEZERS

1. Remove the evaporator-housing lid, located on the cabinet top, exposing the evaporator fan motor.

2. Remove the wiring box cover. Locate and disconnect the fan motor wires.

3. Remove the fan bracket mounting screws. Disconnect the wiring terminals from the motor. Remove the defective motor and replace with the new motor. Replace screws.

4. Reconnect motor wires in wiring box. Check to make sure that wire access hole through the evaporator box is properly sealed and reseal if necessary.

5. Replace wiring box cover.

6. Replace the evaporator-housing lid.

7. Reconnect power and return to normal use.
TEMPERATURE CONTROL – REFRIGERATORS & FREEZERS

1. Remove the front louvered hatch cover by lifting straight up and pulling straight out.

2. Lay the hatch cover on top of the freezer evaporator housing.

3. Remove the (6) screws from the thermostat/wiring box front.

4. Remove the (2) mounting screws and the control knob from the face of the control.

5. Remove the lid from the evaporator housing by unlocking the (4) hold-down latches.

6. Remove the temperature control sensor from the aluminum sleeve by pulling out slowly. Remove the sensor from the evaporator housing.

7. Replace the temperature control and install sensor.

8. Reset the temperature to setting #4 to #5 on refrigerators and #5 to #6 on freezers.

Important
Do not disconnect the wires to the digital thermometer display.
TEMPERATURE CONTROL – HEATED HOLDING CABINETS

Dial Type
1. Turn off the main power to the cabinet.
2. Loosen the control box by removing the two screws on the front louvered hatch cover.
NOTE: Control may be accessed easier from the cabinet rear.
3. Remove the temperature control knob and take out the two mounting screws.
4. Disconnect the wire leads to the temperature control.
5. Reverse steps 1-4 to install the new control.

Digital Type
1. Turn off the main power to the cabinet.
2. Remove the front louvered hatch cover by lifting up and pulling straight out.
3. Remove the 2 mounting screws that secure the temperature control box to the front louvered hatch cover.
4. Disconnect the wires from the back of the digital control box.
5. Press the locking tabs inward on the control box and slide it out of the louvered hatch cover.
6. Reverse steps 1-5 to replace the control, (refer to the diagram below for correct wiring).

Digital Controller – Back View

- SPI SENSOR POWER
  - NO C NC G S +
  - ORANGE ORANGE BLACK PINK PINK
  - FROM sensor FROM sensor
  - To “A” terminal on relay
  - Connect with red wire from transformer (not polarized) & pink wire from “B” terminal on relay
  - Connect with red wire from sensor
DEFROST HEATER ELEMENT

1. Remove the front lowered hatch cover by lifting up and pulling straight out.

2. Remove lid of evaporator housing, located on top of unit.

3. Remove coil mounting screws and lift coil up slowly, exposing coil heater.

4. Disconnect coil heater wiring (see the following figure for 1-section cabinets and the figure on the next page for 2 and 3 section cabinets) and simply pull heater from coil mounting area.
5. Install new heater by gently tapping heater back into the mounting area by using a rubber mallet or similar object.

6. Reconnect wiring and reposition evaporator coil.

7. Secure coil with mounting screws.

8. Reposition evaporator cover lid and lock down latches.

9. Reattach the louvered hatch cover, making sure that the thermometer connections are firmly engaged.

10. Return to normal use.
Section 4

EVAPORATOR DRAIN PAN HEATER ELEMENT

**Warning**
Disconnect the electric power to the freezer before proceeding with the following steps.

1. Remove front louvered hatch cover by lifting up and pulling straight out.

2. Remove the evaporator box cover lid.

3. Remove coil mounting screws and lift coil up slowly, not to detach lines or wiring.

4. Disconnect the heater wires located in the wiring box for 2 and 3 section cabinets or wiring bundle for 1 section cabinets.

Continued on next page ...
5. Replace drain pan heater and reconnect wiring.

6. Reposition evaporator coil and secure with mounting screws.

7. Reposition the evaporator housing cover and lock down latches.

8. Attach front louvered hatch cove, making sure that the thermometer connections are fully engaged.

9. Return to normal use.

HEATER ELEMENT – HEATED HOLDING CABINETS

1. Turn off the main power to the cabinet.

2. Remove the right side blower panel by removing the (13) screws.

NOTE: Blower motor wiring may be disconnected to allow easier blower panel removal.

3. Disconnect the wiring leads to the element by loosening the nuts with a small wrench.

4. Replace the heater element.

5. Reverse steps 1-3 to re-install the wiring and blower panel.

THERMAL LIMIT SWITCH – HEATED HOLDING CABINETS

1. Turn off the main power to the cabinet.

2. Remove the right side blower panel by removing the (13) screws.

NOTE: Blower motor wiring may be disconnected to allow easier blower panel removal.

3. Disconnect the wiring leads to the limit switch.

4. Drill out the (2) rivets holding the switch in place.

5. Replace the limit switch and secure with rivets or screws.

6. Reverse steps 1-3 to re-install the wiring and blower panel.

BLOWER FANS – HEATED HOLDING CABINETS

1. Turn off the main power to the cabinet.

2. Remove the right side blower panel by removing the (13) screws.

NOTE: Blower motor wiring may be disconnected to allow easier blower panel removal.

3. Disconnect the fan motor lead wires and replace motor.

4. Reverse steps 1-2 to re-install the wiring and blower panel.
DIGITAL THERMOMETER DISPLAY AND PROBE

1. Remove the front louvered hatch cover by lifting straight up and pulling straight out.

2. Unplug the thermometer probe from the back of the digital display module.

3. Unscrew from bracket the display module from the hatch cover back with a flat blade screwdriver or scraping tool.

4. Disconnect the (2) yellow wires from the probe harness. Remove the probe from the interior ceiling by loosening the mounting bracket screw.

5. Remove the Permagum sealant from the cabinet top where the probe wire penetrates the top. Carefully pull the probe wire through the cabinet top.

6. Feed the new probe wire through the top hole and reattach the probe and bracket to the interior ceiling.

7. Carefully, pull the wire taught and reseal the cabinet top hole with the Permagum.

Continued on next page ...
8. Carefully align the module with the rectangle cutout in the hatch cover.

9. Plug the probe wire terminal onto the back of the display module, making sure that the plug lines up with the pins on the module.

10. Reconnect the (2) yellow wires from the transformer with the gray leads on the probe.

11. Reinstall the hatch cover and secure any excess wire with a wire tie.

12. Check operation and return to normal service.
DIGITAL THERMOMETER TRANSFORMER

<table>
<thead>
<tr>
<th>Warning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disconnect the electric power to the freezer before proceeding with the following steps.</td>
</tr>
</tbody>
</table>

1. Remove the front louvered hatch cover by lifting straight up and pulling straight out.

2. Remove the (6) screws from the wiring box front.

3. Disconnect the black and white wires on the transformer from the power and neutral wires in the wiring box.

4. Disconnect the yellow wires on the transformer from the (2) gray wires on the transformer probe.

5. Remove the transformer from the evaporator housing and replace with the new transformer.

6. Reconnect all wiring.

7. Replace the top louvered hatch cover.

8. Power up the freezer.

9. Return to normal operation.
DOOR HANDLE – SOLID DOORS

1. Remove the foot from the door lock assembly.

2. Pry off gray plug button (located in the rear center of the door) and a small section of the door gasket nearest the lock assembly (see the next two figures).

3. Remove out the two mounting screws and remove the door handle.

4. Reverse steps 1-3 to install the new door handle.
DOOR HANDLE – GLASS DOORS
1. Pry or lift off a small section of door gasket behind the door handle, exposing the (2) handle mounting screws.
2. Remove the two mounting screws to release the handle.
3. Replace door handle.
4. You may need a rubber mallet to re-install gasket.

DOOR HINGE – SOLID DOORS
1. Remove the door by lifting straight up. Carefully set the door aside.
2. Pry off the hinge cover with a thin flat blade screwdriver.

Continued on next page …
3. Remove the (3) three hinge mounting screws from each hinge on the cabinet front. Replace the hinge and reattach with the screws.

4. Remove the (3) three hinged mounting screws from each flange on the door and replace hinge.

5. Install the door and check operation.

DOOR GASKET – SOLID DOORS

1. Remove the old gasket by pulling the gasket from the foamed in retainer in the door.

2. Starting the upper left corner of the door, place the locking male lip into the retainer of the door.

3. Firmly press into place until the gasket locks.

4. If necessary, gently tap into place with a rubber mallet.
DOOR GASKET – GLASS DOORS
1. Remove the old gasket by pulling the gasket from the foamed in retainer in the door.

2. Starting the upper left corner of the door, place the locking male lip into the retainer of the door.

3. Firmly press into place until the gasket locks.

4. If necessary, gently tap into place with a rubber mallet.

DOOR LOCK – SOLID DOORS
1. Remove latch on lock assembly.

2. Remove the (2) two handle mounting screws and carefully pull handle off the door. Refer to door handle replacement procedures for handle removal procedures.

3. Remove the remainder of the lock assembly and replace.

4. Check operation.
VINYL BREAKER STRIPS – DOOR JAMBS

1. Remove the flat vinyl breakers by gently prying off with a flat-blade screwdriver.

2. Remove the corner blocks as necessary by slipping the male tab from the flat breaker.

3. Replace the breakers by starting each end into the corner blocks and snapping into place.

4. Gently tap the breaker into place if necessary, using a rubber mallet.

---

**Warning**

Disconnect the electric power to the freezer before proceeding with the following steps.

**Warning**

Door heater wires lie directly behind the front edge of the flat breaker strips. Take care not to damage the wires.
ANTI-CONDENSATE DOOR HEATER WIRES

**Warning**
Disconnect the electric power to the freezer before proceeding with the following steps.

1. Remove the vinyl door breakers as described previously.
2. Carefully, pull the heater wire connections from the inside top corner.
3. Clip the connections, making sure to leave enough wire length to reconnect the new heater wire.
4. Remove the old heater wire.
5. Starting at the inside corner, carefully place the new heater wire around the door perimeter, fitting it into the space between the primary breaker retainer and the metal cabinet face.
6. Connect each end of the heater wire to the leads in the corner.
7. Replace the breaker strips as described previously.

---

DEFROST TERMINATION/FAN DELAY SWITCH

**Warning**
Disconnect the electric power to the freezer before proceeding with the following steps.

1. Remove the evaporator-housing lid.
2. Locate the 3-wire defrost termination/fan delay switch, clamped to the suction line.

**Warning**
Disconnect the electric power to the freezer before proceeding with the following steps.

Continued on next page …
3. Remove the wiring box cover on the front of the evaporator housing on 2 and 3 section cabinets. Wiring connections for 1 section cabinets are located inside evaporator housing.

4. Trace and disconnect the defrost termination/fan delay switch from the wiring bundle. Re-connect the new switch.

5. Attach the new switch to the suction line.

6. Replace the evaporator-housing lid.

7. Connect the power and resume normal operation.

NOTE: The evaporator fan will not restart until the fan delay switch senses 32°F from the suction line.
## Section 5
### Before Calling for Service

**Checklist**

If a problem arises during operation of your cabinet, follow the checklist below before calling service. Routine adjustments and maintenance procedures are not covered by the warranty.
